

**Name: - Shubham Nighot**

**Program Name: - CreateTable JDBC**

```
import java.sql.*;
import java.sql.DriverManager;
import java.sql.Statement;
public class CreateTable {
    public static void main(String[] args) {
        //Step1: Load Driver or register
        try {
            Class.forName("com.mysql.jdbc.Driver");
            System.out.println("Driver Load Successfully");
            //step 2: Create Connection
            Connection con=DriverManager.getConnection("jdbc:mysql://localhost:3306/jdbc","root","");
            System.out.println("Connection Create successfully");
            //Step3: create statement object
            Statement stmt= con.createStatement();
            System.out.println("statement create successfully");
            //step 4: write query
            String sql="create table info (id int,name varchar(20),address varchar(30))";
            //Step 5: execute query
            stmt.execute(sql);
            System.out.println("table created successfully");
        }
        catch(Exception e) {
            e.printStackTrace();
        }
    }
}
```
